SOFTWARE DEVELOPMENT BY THE MONTAGUE GROUP

1982 (undergraduate) Developed computational methods for rapid *ab initio* calculations to estimate molecular orbital cross sections in ethane. Programs written in FORTRAN 77 and run on IBM 370.

1984-85 (medical student) Developed optimization programs for fitting multidimensional models to datasets derived from recordings of neuronal units from mammalian visual cortex. Program ran online under RT-11, DEC's real time operating system. Developed optimization programs for re-alignment and three dimensional reconstruction of stacked electron micrographic sections.

1986-1988 (graduate student) Developed computer programs to perform automatic calculation of Hausdorff dimension (one kind of fractal dimension) of neuronal structures – programs written in C, C++, and assembly code. Outcome of this work was communicated to Proceedings of National Academy of Sciences by Torsten Wiesel.

1989 (postdoctoral fellow) Developed neural network simulation and simulation environment. Received patent 5,485,546 for the methods by which the simulations learn from experience. In the neuroscience community, the learning rule is now known as 'volume learning'. Also developed algorithms for mapping spatial problems onto massively parallel supercomputers. In particular, a fast method for mapping problems onto hypercube topologies (e.g. N-Cube computer) was developed. Program also allowed the growth and development of volumes of neural tissue. This work was carried out in collaboration with Gerald M. Edelman (Rockefeller University, New York, NY).

1991 Developed reinforcement learning algorithm to explain foraging behavior in bees. Developed learning algorithms to explain self-organized development of the visual cortex. Implemented in C on Sun, Silicon Graphics workstations. Also ported to parallel Intel Paragon computer (512 processors).

1993 Developed virtual environment simulation in which a simulated bee moved about and foraged on a simulated field of flowers. The entire world was dynamic with the bee gathering sensory information while moving and learning to improve its foraging behavior. The simulated field also grew and changed. This work was profiled in Nature magazine, Time magazine, New York Times, London Daily Telegraph, and other major journalistic outlets. Code written in C and implemented on Silicon Graphics workstations.

1996 Developed new simulation environment for estimating calcium dynamics in the extracellular space of mammalian neural tissue. This simulation used a combination of Monte Carlo and finite difference techniques and was written in C. It is now being ported to a Java implementation for use over the web.

1998 Developed model of human economic decision-making using Java program that samples human's decision-making performance and predicts future performance. Also, developed Java simulation of fluctuations of dopamine delivery to brain tissue. Dopamine systems are those hijacked by drugs of abuse. This work was profiled on a PBS special, New York Times Science Section, Japanese News Magazine (Fuji Television Network), and other news outlets.

2000 Designed and implemented a method for linking ongoing fMRI scanning experiments over the web (**hyperscanning**). This software is written in Java. Pilot 'linked scanner' experiments have now been carried out at Emory University and Princeton University.

2002-2003 Led development of full web-based Hyperscan software that allows for simultaneous brain scanning of behaviorally interacting subjects. This software has made possible the simultaneous study of socially interacting brains. This project is organized through the Human Neuroimaging Laboratory at Baylor College of Medicine. It is an open source project with release scheduled for fall 2003. The software modules for remotely executing, monitoring, and analyzing functional MRI experiments will be included in the release.

2005 March 15, 2005. Open source release of hyperscan software (called NEMO) for remote synchronization, control, and viewing of fMRI experiments (see <http://labs.vtc.vt.edu/hnl/nemo>). May 31, 2005 – First inter-continental hyperscan experiment using two-person trust exchange, Baylor College of Medicine and Hong Kong University of Science and Technology. July 5, 2005 – Second intercontinental hyperscan experiment, Baylor College of Medicine and Universitat Ulm.

2006 Graphical user interface development and generalization of NEMO into a multi-user, multi-site tool for interactive social exchange experiments.
